

Repository Audit

Review basis

- Repository: <https://github.com/karthikv1711/Darshan-Ease>
- Branch reviewed: `main`
- Commit: `d1c1a5fe2cbdb2c254892f51d9ba0d3832b1bcd`
- Commit subject/date: `Update README.md`, 12 July 2026 (UTC+05:30)
- Review date: 18 July 2026
- Approximate checkout size: 35 MB
- Approximate JavaScript/JSX/CSS project lines counted: 7,584

Source inventory

Area	Notable files
Root	<code>.gitignore</code> , <code>README.md</code>
Client configuration	<code>package.json</code> , <code>package-lock.json</code> , <code>vite.config.js</code> , <code>.oxlintrc.json</code>
Client pages	Home, Login, Register, TempleDetails, Donation, three dashboards
Client components	Navbar, Footer, BookingModal, DeityIntroModal, audio player
Client contexts	AuthContext, AudioContext
Static content	Six temple/deity images, three MP3 tracks, icons/favicon
Server configuration	Database connection and seeder
Server routes	Auth, temples, slots, bookings, donations, admin
Server controllers	Six controller modules
Server models	User, Temple, DarshanSlot, Booking, Donation
Server middleware	JWT protection and role checks

Feature-to-source map

Feature	Frontend	Backend
Authentication/profile	<code>AuthContext</code> , Login, Register, dashboards	<code>authRoutes</code> , <code>authController</code> , User model, auth middleware
Temple discovery/details	Home, TempleDetails	temple routes/controller/model
Slots	TempleDetails, Organizer dashboard	slot routes/controller/model
Booking hold/ticket	BookingModal, User dashboard	booking routes/controller/model

Feature	Frontend	Backend
Donation receipt/history	Donation, User dashboard	donation routes/controller/model
Admin management/analytics	Admin dashboard	admin routes/controller plus temple controller
Seed content	Public images/audio	<code>config/seeder.js</code>

README discrepancies

The repository README is visually polished but generic and materially outdated relative to the code:

- It lists only HTML/CSS/JavaScript rather than React/Vite/Axios/Router.
- It says Express is used “if used,” although Express is the implemented backend.
- It does not identify MongoDB/Mongoose, JWT, bcrypt, roles, booking, donations, reviews, or dashboards.
- It describes authentication, database integration, and admin dashboard as future work even though they exist.
- It instructs frontend `npm start`, but the client has no `start` script.
- It suggests port 3000; Vite normally uses 5173 and the API uses 5000.
- It claims an MIT license, but no `LICENSE` file is present in the reviewed tree.
- It contains no API reference, environment variable guide, test status, security limitations, or simulated-payment warning.

Maintainability observations

- Business logic is concentrated in controllers and large JSX pages/components.
- Inline styling is extensive, which makes consistent UI evolution harder.
- There is repeated form/payment validation between booking and donation.
- There is no API client abstraction beyond global Axios defaults.
- Error handling/logging is inconsistent and sometimes ignores caught errors.
- No pagination exists for users, bookings, donations, temples, or slots.
- `server/index.js` only requires `server.js` and is not the package entypoint used by scripts.
- Both `npm start` and `npm run dev` execute `node server.js`; no development watcher is configured.
- `server/node_modules` is committed even though dependency lockfiles exist.

Recommended documentation ownership

Document	Update trigger	Owner suggestion
SRS/use cases	User-visible behavior or policy changes	Product + engineering
Architecture/data design	Component, schema, or authorization changes	Tech lead
API reference	Route/payload/status changes	Backend owner
Developer guide	Toolchain/configuration changes	Engineering
Test/security review	Every release and security fix	QA + security + engineering

Document	Update trigger	Owner suggestion
User manual/demo	UI workflow changes	Product/QA
Deployment/operations	Infrastructure/runbook changes	Platform/operations
