

User Manual

Guest

1. Open the home page.
2. Enter part of a temple name and/or location and select **Search**.
3. Select **Book Darshan** on a temple card.
4. Review temple hours, description, amenities, events, ratings, and available dates/slots.
5. Use the floating audio control to mute/unmute the temple track.

Guests can browse but must sign in to book, donate, or review.

Create an account and sign in

1. Select **Register**.
2. Enter name, email, password (the UI requires at least six characters), optional phone/address, and solve the math prompt.
3. Select **Register**. A successful response signs you in automatically.
4. Returning users use **Login** with email/password.

Security note: the current form displays role choices, including administrator. That is an implementation flaw, not a recommended user workflow. Production registration must always create a normal devotee account; privileged accounts must be provisioned by an authorized administrator.

Devotee booking

1. Sign in with a **USER** account.
2. Open a temple and choose a future slot with enough seats.
3. Select **Book Now** and choose the number of devotees.
4. Enter each devotee's name, age (UI accepts 1–120), and gender.
5. Submit to create a five-minute seat hold.
6. On the simulated checkout screen, enter a 16-digit card number, a non-expired month/year, and a three-digit CVV.
7. Confirm before the timer expires.
8. Print the generated ticket. The ticket includes temple, slot, devotees, amount, booking status, and a **DE-** ticket code.

No real payment is charged. Card data is validated in the browser and is not included in the backend confirmation request.

User dashboard

Open **Dashboard** from the navigation menu.

- **My Bookings:** view booking status and ticket details.
- **My Contributions:** view recorded donation receipts.
- **Profile Settings:** update name, email, phone, address, or password.

Although a cancellation handler exists in the source, the current booking-list UI does not expose a cancellation button. Cancellation is available through the API and has a known seat-restoration defect for pending holds.

Donations

1. Open **Donations**.
2. Sign in if prompted.
3. Select a temple, preset/custom INR amount, purpose, and donor name or anonymous option.
4. Complete the simulated card-format fields.
5. Submit and print the donation receipt.

The generated transaction record is a demo record, not proof of bank settlement or a tax receipt.

Reviews

On a temple detail page, an authenticated user can choose a rating, enter a comment, and submit. Submitting again updates that user's existing review for the same temple. Seeded anonymous-style ratings without a user reference remain separate.

Organizer dashboard

- **Slot Scheduler:** select a temple and enter date, time range, seats, and price; create or delete slots.
- **Bookings Manager:** view booking records.
- **Notifications:** view demo-only in-memory notifications; they are not generated by the backend.
- **Profile Settings:** update organizer profile.

Current organizers are not assigned to specific temples and can access global organizer data. Do not use this authorization model in production.

Admin dashboard

- **Analytics:** user/organizer/temple totals, booked counts, simulated revenue, temple popularity, and age demographics.
- **Users:** filter by role and delete accounts.
- **Temples:** create and delete temples.
- **Events:** schedule events.
- **Facility:** log maintenance requests and update their statuses.

The API also supports user updates, temple updates, and event deletion, but the current dashboard does not provide all of those controls.

Troubleshooting

Symptom	Likely cause	Action
"Database is offline" / 503	MongoDB not connected	Start MongoDB or correct <code>MONGODB_URI</code> ; restart server if needed

Symptom	Likely cause	Action
Client cannot reach API	Backend stopped or fixed localhost URL unsuitable	Start port 5000 server; configure environment-based API URL
401	Token missing, invalid, or expired	Log out and sign in again
403	Account role lacks permission	Use the correct authorized account; do not bypass the API
No future slots	Seed slots passed or organizers have not added slots	Create new future slots
Hold expired	Five-minute window elapsed	Close and start a new booking
Dashboard appears but data fails	Frontend routes lack role guards	Use the dashboard matching the authenticated role
